

Project Risks - *Akeela*

Since Australia is such a diverse country, it will be a challenge to translate into every single language spoken here for each of our videos' closed captions so we will likely use google translate or other reliable auto-translate technologies to make it as accessible as possible. However, we could always push that back and add translation as an update later on if it takes too long to develop and will delay the launch of our product. Another challenge will be the AI chatbot. As a team, we do not have the necessary skills and experience in developing such a complex feature so we will need to work on developing our skills for it. Having such an intricate feature, it's vital that our website can support it without crashing or causing any errors. During the project, we will test it, however, there can always be errors we did not pick up on. Another possible challenge will be the quiz. We assigned two strong web programmers to take charge in developing that feature as it is something none of us have much experience with. We may not be able to complete a comprehensive enough quiz that covers the content with a simple interface. Additionally, coding a quiz that can correct answers and suggest a relevant point of reference for an incorrect answer will be a challenge so we aim to do as much research and consult industry persons with experience in this area that can guide us.
